

Wing panel fastening and gap control

© AIRBUS S.A.S. 2010 - COMPUTER RENDERING BY FIXION - GWLNSD

Prof. Matti Heilio (LUT) Florian Gensheimer (UKOLD) Nadezhda Zaitseva (SPBPU) Ramona Maraia (LUT) Sebastian Springer (LUT)

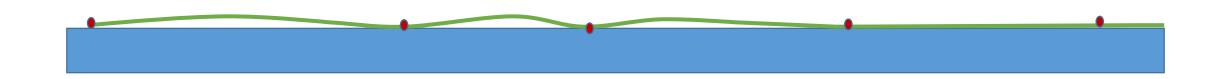

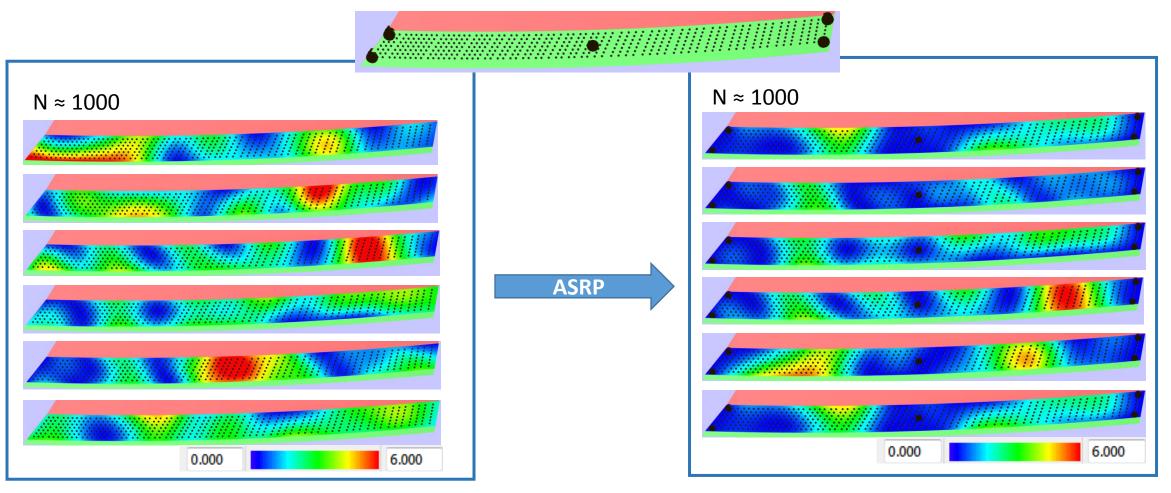

Target: Gap < 0,2mm

Current procedure

P = 7.0%

 $P\{Gap(x,y) < 0.2 \ mm\} = \frac{Number \ of \ points, where \ gap < 0.2 \ mm}{Number \ of \ all \ points}$

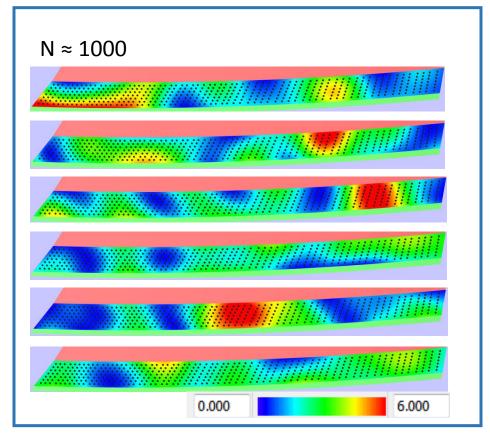

Current procedure

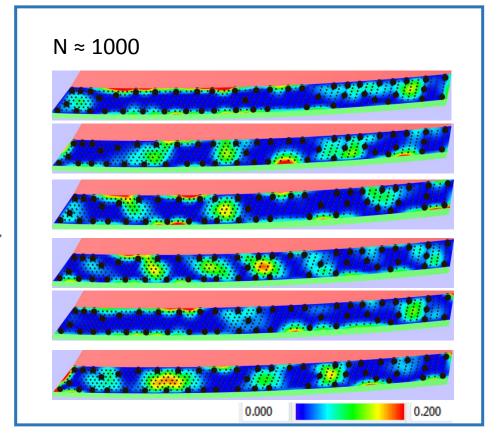

ASRP

P = 7.0%

$$P = 98.9\%$$

•	•	•	•	•	•	•	•	•	•	•	•	•	•	•	•	•	•	•	0		-		_											

Strategy

- 1. Divide wing in a set of zones $\{L_i\}_{i=1}^M$
- 2. Put initial fasteners, if they are not pre-installed.
- 3. While Total gap $>G_{max}$

$$x_{cand} = \underset{x_j \in L_i}{\operatorname{agrmax}} P\{Gap(x_j) < G_{max} | T_j\},$$

Where T_j is the triangle built from the 3closest fastened points around x_j and fix it.

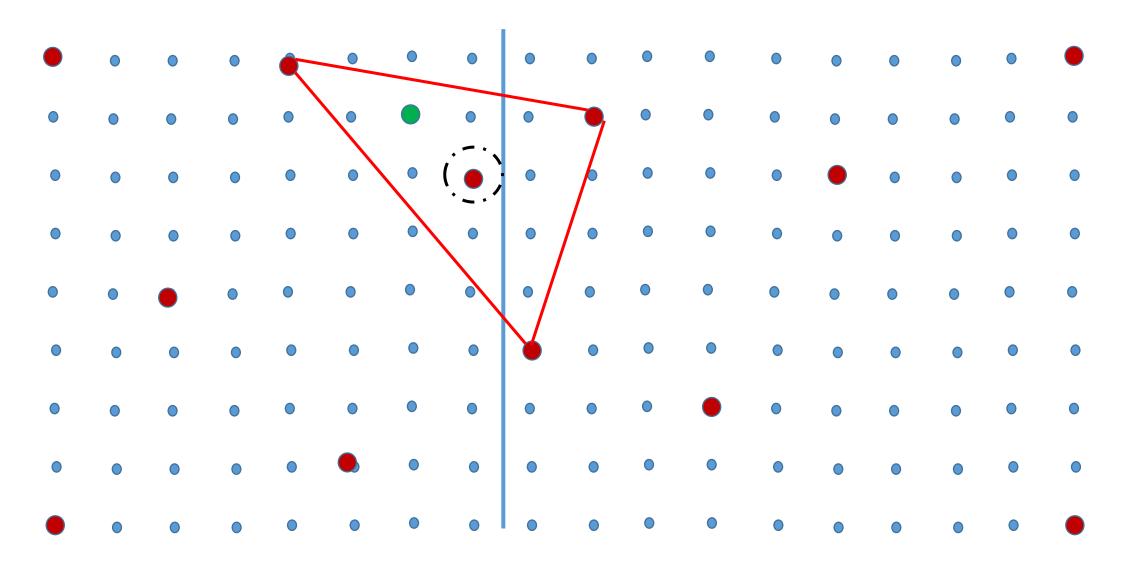

Where to add the next fastener?

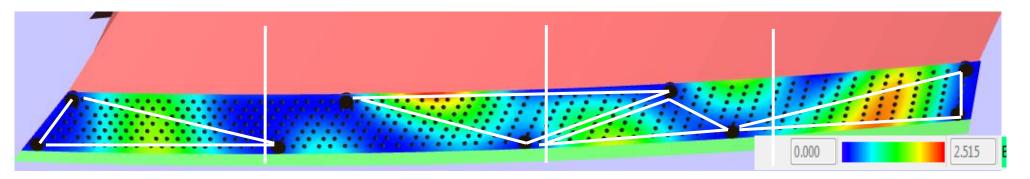

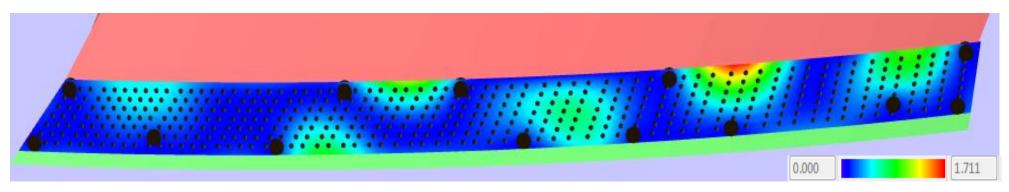

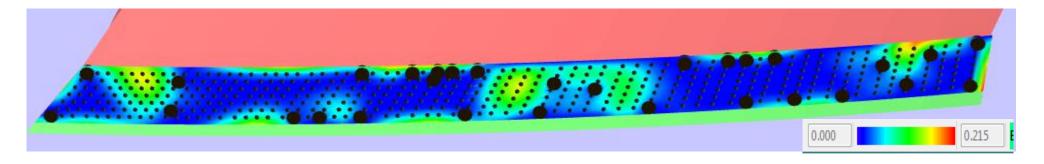

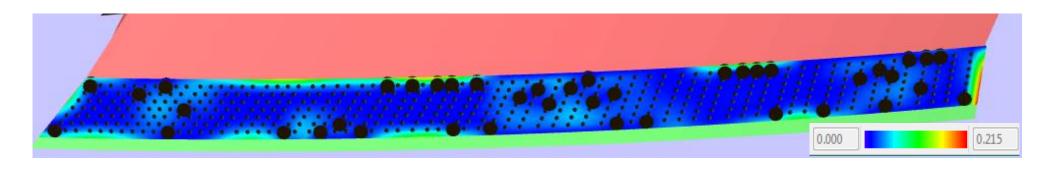

The example Business Engineering Powerflute Education Study Groups BOSCH

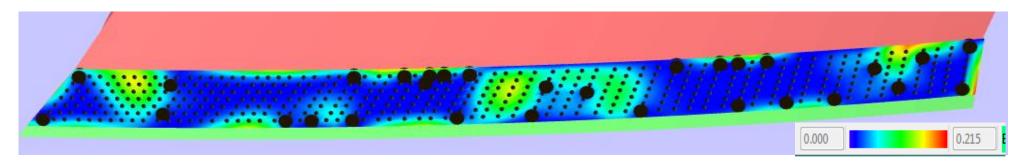

Old: 41 fasteners out of 468 holes (8.76 %)

New: 30 fasteners out of 468 holes (6.41 %)

=> 27 % less fasteners

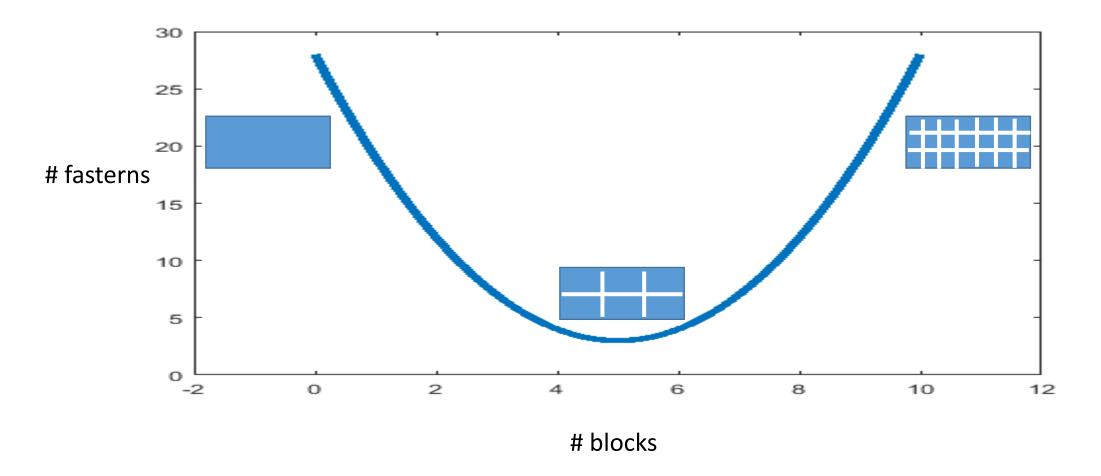

Possible Improvements 1/2

- Optimize the number of blocks

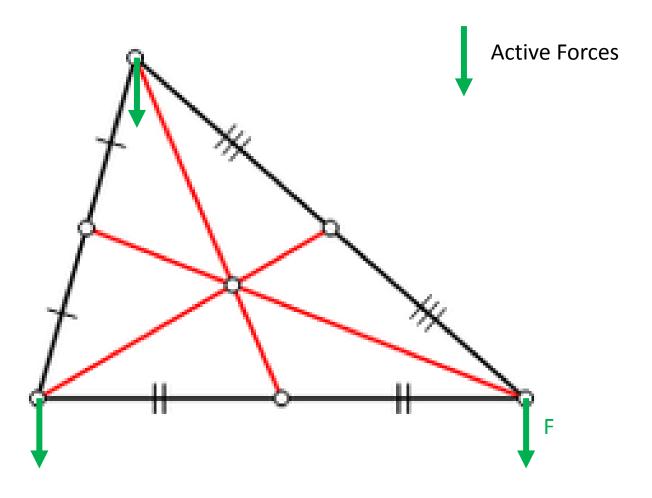

Possible idea for further research?

- Take max 20 temponary fasteners (gap $\Delta z = 0$)
- Fix outer points by setting also $\Delta x = \Delta y = 0$

Apply next fastener and compute the actual displacements and the mechanical bulging effect on neighbouring area
